Dear Mr. Nebu:

RE: SECOND QUARTER 2007 GROUNDWATER MONITORING REPORT, ASSOCIATED PLATING COMPANY, 9636 ANN STREET SANTA FE SPRINGS, CALIFORNIA

WorleyParsons Komex is pleased to submit the attached Second Quarter 2007 Groundwater Monitoring Report for the Associated Plating Company (APC) located at 9636 Ann Street, in the city of Santa Fe Springs, California. This report presents the results obtained from the groundwater sampling conducted at the APC facility in May 2007. If you have any questions or comments, feel free to call at (310) 547-6349.

Sincerely,
WorleyParsons Komex

Lee Paprocki

ASSOCIATED PLATING COMPANY
SECOND QUARTER 2007 GROUNDWATER MONITORING REPORT
ASSOCIATED PLATING COMPANY, 9636 ANN STREET, SANTA FE SPRINGS, CALIFORNIA

1. INTRODUCTION

This document has been prepared by WorleyParsons Komex on behalf of the Associated Plating Company (APC). The report summarizes the groundwater sampling conducted at 9636 Ann Street, Santa Fe Springs, California (herein referred to as the Site). The Site is located in Santa Fe Springs, California at an elevation of approximately 150 feet above mean sea level (MSL) with a local topographic gradient of less than 20 feet per mile to the southeast (Figures 1 and 2).

Monitoring wells, MW-1 through MW-4, were installed at the Site on April 5 and 6, 2006 (Table 1) and were first sampled a week later (Figure 3). Groundwater sampling and analysis completed at the Site during April 2006 identified the presence of chlorinated solvents and petroleum hydrocarbons.

The Department of Toxic Substances Control (DTSC), in their letter dated December 14, 2005 and in a meeting on August 22, 2006, requested that quarterly groundwater sampling be continued for one year. Therefore, second quarter groundwater sampling was conducted in May 2007 and is summarized in this report.

1.1 Geology and Hydrogeology

1.1.1 Regional Geology and Hydrogeology

Los Angeles County is underlain by the Los Angeles County Coastal Plain and is bounded by the Santa Monica Mountains to the north, the low lying Elysian, Repetto, Merced, and Puente Hills to the northeast, a political boundary coinciding with the boundary between Los Angeles County and Orange County to the southeast, and the Pacific Ocean to the southwest. Alluvial fans formed by the Los Angeles, Rio Hondo, and San Gabriel Rivers systems have coalesced to form the Downey Plain, which represents the largest area of recent alluvial deposition in the Coastal Plain. The Downey Plain is bordered by the La Brea, Montebello, and Santa Fe Spring Plains, and the Coyote hills to the north and northeast, the Newport Inglewood uplift to the southwest, and the Coastal Plain of Orange County to the southeast (DWR, 1961). The Downey Plain slopes gently to the south with an average gradient of less than 18 feet per mile. The Site is located between the Downey Plain and the Santa Fe Springs Plain. The Santa Fe Springs Plain is located south of Whittier and east of the San Gabriel River, in the area of the City of Santa Fe Springs. The Santa Fe Springs Plain is a low, slightly rolling topographic feature and represents a continuation of the Coyote Hills Uplift to the southeast.

The Coastal Plain of Los Angeles County is a deep groundwater reservoir filled by unconsolidated alluvial sands, gravels, clays, and silts. Fresh-water aquifers extend to depths of over 2,000 feet. The California Department of Water Resources (DWR) divided the coastal plain into four groundwater basins: the Santa Monica Basin, the West Coast Basin, the Hollywood Basin, and the Central Basin (DWR, 1961). The Site lies within the Central Basin, which is further divided into four parts for descriptive purposes: the Los Angeles Forebay Area, the Montebello Forebay Area, the Whittier Area, and the Central Basin Pressure Area.

The Site is located in the Central Basin Pressure Area. The Central Basin Pressure Area is called a "pressure area" because the aquifers within it are confined by aquicludes over most of the area. The major regional aquitards and aquifers beneath the Site occur in the Recent Alluvium, the Upper Pleistocene Lakewood Formation, and the Lower Pleistocene San Pedro Formation. Depth intervals for the major regional hydro-stratigraphic units (aquitards and aquifers) in the Site vicinity are presented in the table below:

Regional Hydro-stratigraphic Unit	Formation	Approximate Depth Intervals (feet below ground surface)
Bellflower Aquitard	Recent Alluvium	0 – 30
Gaspur	Recent Alluvium	30 – 65
Gage	Lakewood	65 – 110
Hollydale-Jefferson	San Pedro	110 - 130
Lynwood	San Pedro	130 – 210
Silverado	San Pedro	210 – 360
Sunnyside	San Pedro	360 - 610

1.1.2 Site Geology

The Site is underlain with artificial fill composed primarily of silt from the ground surface to an approximate depth of 7 feet below ground surface (bgs). At approximately 7 feet bgs a concrete pad is encountered, which is approximately four inches thick. Underlying the concrete pad is a silt and clay layer that extends to approximately 25 feet bgs. Below the silt and clay layer is a sand and gravelly

sand layer that extends to at least 48 feet bgs (Figure 4). Both the silt and clay layer and the sand and gravel layer correspond to the Recent Alluvium.

1.1.3 Site Hydrogeology

In April 2006, first groundwater was detected between 34 and 38 feet bgs (approximately 112 feet MSL) and corresponds to the Gaspur Aquifer. In May 2007, water levels were between 33.26 and 37.32 feet bgs. Groundwater flow varies between the southwest and south-southeast at an approximate gradient of 0.003 feet per foot (ft/ft).

1.2 Site Conceptual Model

In accordance with the Site conceptual model developed below, the subsurface at the Site and Site vicinity was previously divided into three operable units: Operable Unit 1 (OU-1), Operable Unit 2 (OU-2), and Operable Unit 3 (OU-3) (Figure 4). OU-1 consists of fill material underlying the Site from ground surface to the top of the buried concrete pad (approximately 7 feet bgs). OU-2 consists of on-Site soils and the first groundwater zone, from the base of the concrete pad to approximately 50 feet bgs. OU-3 consists of the off-Site soils and the first groundwater zone.

Fill material in OU-1 is impacted by petroleum hydrocarbons (C7 to C36), fuel volatile organic compounds (VOCs), probably representing pre-existing contamination from the former storage tank, and chlorinated solvent compounds, consistent with releases of tetrachloroethene (PCE) from the APC facility.

2. GROUNDWATER SAMPLING

2.1 Groundwater Gauging and Sampling Procedures

Well construction details for the four groundwater monitoring wells (MW-1 through MW-4) are included in Table 1. On May 16, 2007, the four monitoring wells were gauged, then purged and sampled. Following gauging, the wells were purged of at least three well volumes of water, allowed to recover, and then sampled. Groundwater gauging and sampling field notes are provided in Appendix 1.

2.2 Waste Disposal

Waste generated as part of this investigation included purged groundwater and decontamination water used during sampling. Water was contained in two Department of Transportation (DOT) approved 55-gallon drums and temporarily stored at the Site prior to disposal. On June 8, 2002, groundwater and decontamination water were removed from the Site and transported to a suitable off-Site disposal facility by a licensed non-hazardous waste hauler. The waste manifest is provided in Appendix 2.

2.3 Quality Assurance/Quality Control Sampling

Field quality assurance/quality control (QA/QC) samples were collected on May 16, 2007, during groundwater sampling activities. An equipment rinsate blank was collected from the groundwater electric pump by running distilled water through the pump hose into two 40-milliliter (ml) volatile organic analysis (VOA) vials. A field blank was collected by filling two 40 ml VOA vial with distilled water, leaving them exposed to ambient air during collection of the equipment blank, and then sealing them. A trip blank, consisting of one sealed 40 ml VOA vial filled with distilled water, was obtained from the laboratory and kept in the ice-chest throughout the day to evaluate if there was any introduction of VOCs during storage and transportation.

2.4 Laboratory Analyses

Monitoring well groundwater samples and QA/QC samples were labeled, placed in an ice chest, and delivered under chain-of-custody (COC) to Sierra Analytical Inc. of Laguna Hills, California, within 24 hours of collection. The samples were analyzed for the following:

- Total petroleum hydrocarbons (TPH), ranging from C7 to C36, in accordance with USEPA Method 8015B; and
- VOCs in accordance with USEPA Method 8260B.

3. GROUNDWATER RESULTS

3.1 Groundwater Results

Groundwater depths in the four monitoring wells ranged from 33.26 to 37.32 feet bgs (113.67 to 113.45 feet MSL) (Table 2). During this sampling event, groundwater flow was generally towards the southwest at a gradient of 0.003 ft/ft (Figure 5).

A sheen of light non-aqueous phase liquid (LNAPL) was observed on the product level probe in two monitoring wells: MW-3 and MW-4.

Groundwater gauging and laboratory analytical results are provided in Tables 2, 3 and 4. The complete laboratory report, including COC and laboratory QA/QC analyses, is provided in Appendix 3.

TPH groundwater results are presented in Table 3. Petroleum hydrocarbons were detected in groundwater collected from all four monitoring wells. The lateral distribution of TPH in groundwater for this sampling event is depicted in Figure 6. Qverall, TPH concentrations in groundwater have decreased from April 2006 to May 2007. Within this year of groundwater monitoring, TPH concentrations have decreased from April 2006 to November 2006 and recently increased from November 2006 to May 2007.

VOC groundwater results are presented in Table 4 and Figure 7. Historical groundwater results are included in Table 4.

PCE has consistently not been detected above the laboratory reporting limits in groundwater collected from upgradient well MW-1. Trichloroethene (TCE) concentrations detected in groundwater collected from well MW-1 have increased significantly from 1.3 micrograms per liter (ug/L) in April 2006 to 41 ug/L in May 2007. Vinyl chloride (VC) concentrations detected in groundwater collected from well MW-1 have decreased from 20 ug/L in April 2006 to 13 ug/L in May 2007. Cis-1,2-Dichloroethene (cis-1,2-DCE) and trans- 1,2 - Dichloroethene (trans-1,2-DCE) concentrations in groundwater from well MW-1 have remained fairly constant at approximately 5 ug/L.

PCE, TCE, cis-1,2-DCE, and trans-1,2-DCE have consistently not been detected above the laboratory reporting limits in groundwater collected from well MW-2. VC concentrations have decreased from 50 ug/L in April 2006 to 24 ug/L in May 2007.

PCE, TCE, cis-1,2-DCE, and trans-1,2-DCE have consistently not been detected in groundwater collected from well MW-3. VC concentrations have decreased slightly in groundwater collected from well MW-3, from 53 ug/L in April 2006 to 32 ug/L in May 2007.

PCE concentrations in groundwater collected from well MW-4 have increased in groundwater, from 2.7 ug/L in April 2006 to 15 ug/L in May 2007. This quarter, TCE was detected in groundwater at a concentration of 4.0 ug/L. Trans-1,2-DCE was not detected above the laboratory reporting limit. Cis-1,2-DCE was detected in groundwater collected during the last three quarterly events, at concentrations between 1 and 2 ug/L. VC concentrations collected in groundwater from well MW-4 have consistently decreased every quarter, from a maximum detected concentration of 57 ug/L in April 2006 to a minimum concentration of 24 ug/L in May 2007.

3.2 QA/QC Analytical Results

The results of QA/QC sample analyses are provided in Table 5. A review of the laboratory analytical report indicates that all internal laboratory QA/QC calibration checks, matrix spike, and matrix spike duplicate recoveries were within acceptable ranges (Appendix 3). VOCs were not detected above the laboratory reporting limit in the field or trip blank. Despite proper decontamination procedures, two VOCs were detected in the equipment blank. 1,2,3-Trichloropropane and TCE were detected in the equipment rinsate blank at concentrations of 1.9 ug/L and 1.8 ug/L, respectively. 1,2, 3-Trichloropropane has not been detected in groundwater beneath the Site. The TCE detection of 1.8 ug/L is significantly less than maximum detected concentration of TCE (41 ug/L), but is of the same order as the minimum detected concentration of 4.0 ug/L of TCE. Therefore, the detection of 4.0 ug/L in well MW-4 is likely an estimate. For any future groundwater sampling, additional decontamination procedures will be performed.

4. CONCLUSIONS AND RECOMMENDATIONS

4.1 Conclusions

In May 2007, groundwater flow beneath the Site was towards the southwest at a gradient of 0.003 ft/ft and depth to groundwater ranged from to 33.26 to 37.32 feet bgs (113.67 to 113.45 feet MSL).

TCE concentrations have increased from April 2006 to May 2007 in groundwater collected from the upgradient well MW-1. VC concentrations in groundwater from well MW-1 have generally decreased. Generally, chlorinated solvent concentrations in downgradient groundwater have remained fairly constant. PCE, TCE, cis-1,2-DCE, and trans-1,2-DCE have consistently not been detected in groundwater collected from wells MW-2 and MW-3. Chlorinated solvent concentrations in groundwater collected from well MW-4 have remained fairly constant with the exception of PCE, which has increased, and VC which has decreased.

4.2 Recommendations

In accordance with the DTSC's request, a full year of quarterly groundwater sampling events have been conducted at the Site. Based on the contaminant trends, it is recommended that a year of semi-annual groundwater sampling be conducted. Based on the previous sampling schedule, the proposed semi-annual sampling schedule would consist of groundwater sampling in November 2007 and May 2008. Semi-annual groundwater reports would be submitted by January 31, 2008 and July 31, 2008, respectively.

5. CLOSURE

We trust that this report satisfies your current requirements and provides suitable documentation for your records. If you have any questions or require further details, please contact the undersigned at any time.

Notes:

1) TPH = total petroleum hydrocarbons (carbon range) analyzed using EPA Method 8015B
2) mg/L = milligrams per liter
3) <0.10 = compound not detected at or above the indicated laboratory reporting limit
4) Bold type indicates compound was detected.

Notes:

1) VOC = volatile organic compounds analyzed using EPA Method 8260B

2) ug/L = micrograms per liter

3) <1.0 = compound not detected at or above the indicated laboratory reporting limit

4) -- = not analyzed

5) Bold type indicates compound was detected.

Notes:

1) TPH = total petroleum hydrocarbons (carbon range) analyzed using EPA Method 8015B
2) VOCs = volatile organic compounds analyzed using EPA Method 8260B
3) mg/L = milligrams per liter
4) ug/L = micrograms per liter
5) <1.0 = compound not detected at or above the indicated laboratory reporting limit
6) Bold type indicates compound was detected.
7) -- = not analyzed

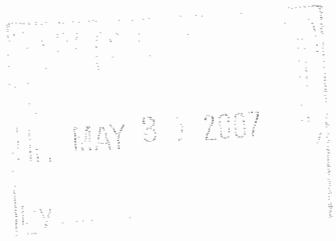
Long Beach, CA 90810-1800

RE:APC

Work Order No.: 0705378



Attached are the results of the analyses for samples received by the laboratory on 05/16/07 13:55.

The samples were received by Sierra Analytical Labs, Inc. with a chain of custody record attached or completed at the submittal of the samples.

The analyses were performed according to the prescribed method as outlined by EPA, Standard Methods, and A.S.T.M.

The remaining portions of the samples will be disposed of within 30 days from the date of this report.
If you require any additional retaining time, please advise us.

Sincerely,

Richard K. Forsyth

Laboratory Director

Sierra Analytical Labs, Inc. is certified by the California Department of Health Services (DOHS), Environmental Laboratory Accredidation Program (ELAP) No. 2320.
